President.

H. B. WINTERSMITH,  
Secretary.

## TO THE TRADE.

In presenting our new Tower, Tank and Tub Catalogue to the public, we do so with pardonable pride, from the fact that it is the most complete Tower, Tank and Tub Price-List ever issued from any factory. Not only does it give the dimensions and capacities in gallons of small Tubs and Tanks used, but those also of the largest.

With SEVENTEEN YEARS' experience in manufacturing Towers, Tanks and Tubs, we have acquired a thorough knowledge of the business and the wants of the trade, which enables us to give valuable assistance to those desiring to erect Mills, Factories or Water Supplies.

Every one who has had experience in the use of wooden tanks and tubs, very readily realizes the necessity of a careful selection of material, perfect joints and close fitting where the bottom enters the croze or recess in the stave, and also hoops of the right size and strength, properly placed. To meet the demands of this necessity, we have equipped our factory with a complete and first-class line of the latest and most improved machinery; and with skilled mechanics and a well selected and full stock of all the various materials which are used for this purpose, we are prepared to serve our patrons on the shortest possible notice with any and all sizes of tanks from 300 to 100,000 gallons capacity.

We use only the best brands of iron and steel for our hoops, with proper width and thickness to each, which, when rightly spaced, insure every tank safe and capable of carrying its intended capacity.

When desired, we furnish our Patent Lugs or Band Fasteners, which for strength, durability and simple adjustment have no equal.

For the construction of Reservoirs or Water Tanks, we invariably recommend SOUTHERN CYPRESS, from the indisputable fact of its superiority for lasting qualities over other classes of wood.

Our Patent Sectional All Iron Towers, which are illustrated herein, are being used for all purposes where an elevated water supply is wanted for fire protection for manufacturing plants; for small cities and towns, and for irrigation of lawns, gardens and private grounds, etc.

This Tower is the strongest and most durable structure for this purpose yet designed and can be easily and cheaply erected. It is also the handsomest in appearance, being neat in design and of symmetrical proportions.

See pages 8 to 18 for full description and prices.

### W. E. CALDWELL CO.,

INCORPORATED,

OFFICE:

218 & 220 E. Main Street,

WORKS:

215 & 217 Brook Street,

LOUISVILLE, KY., U. S. A.,

1894.

NOTE—We are also manufacturers of Iron and Steel Tanks, both round and square, and will furnish same at low prices.

The above capacities are based on tanks having straight staves, but, unless otherwise ordered, we usually make them with a slight taper.

We guarantee the capacities as above to be correct.

All tanks in which the depth ends in even half feet are only made to order.

The above capacities are based on tanks having straight staves, but, unless otherwise ordered, we usually make them with a slight taper.

We guarantee the capacities as above to be correct.

NOTE.—These prices on all tanks up to and including 20 feet in diameter are based on 2-inch thick material; all tanks 22 feet in diameter, and over, are based on 3-inch thick material. All tanks above 15,000 gallons capacity should be made of thicker material than 2-inch. However, we have often made tanks of 25,000 gallons capacity of 2-inch Cypress.

Why should Patent Lugs be used on all Tanks?

Because of the convenience in tightening the hoops at will.

## PATENT SECTIONAL ALL IRON TOWERS.

This cut illustrates our 4-column Patent All Iron Towers, which we build in sections, suitable to support Tanks of dimensions up to and including 18 feet in diameter and of 30,000 gallons capacity.

These Towers are strong, durable and attractive in appearance, and cost much less than Iron Towers of any other design, and, when Durability and Strength are considered, they are **MUCH CHEAPER** than any All Wooden Structures.

FOR PRICES AND ESTIMATED COST OF FOUNDATIONS SEE OPPOSITE PAGE.

This style of Tower is used extensively in connection with **Automatic Sprinkler Plants** for protection against fire in mills, factories and other large buildings, as, whenever a large storage of water is kept on hand, elevated and ready for use, it greatly reduces the fire risk and consequently lessens the cost of insurance. They are also largely used by gardeners and florists for irrigation, and also for water supplies for small villages and private grounds.

They are strong, durable and neat in design, and, as they are built in short sections, and each section is set up independently and finished before beginning to set up the next section, thus making a scaffolding for each succeeding section, the work of erection is easily and cheaply executed.

The iron joint connections are made on angles such as will fit the columns when cut off square on each end and inserted into sockets in the iron couplings. It is all strongly bound together with angle brace rods, as shown in the cut, and all rods are provided with turn buckles for securing proper tension.

There is no great amount of skill required to erect one of these Towers. The cost of the iron work of these Towers over and above that of an ordinary framed all wooden structure is saved in the cost of erection alone.

This cut represents our 63-foot All Iron Tower and 30,000-gallon Cypress Tank.

SEE PRICES AND ESTIMATED COST OF FOUNDATIONS ON OPPOSITE PAGE.

### PATENT SECTIONAL ALL IRON TOWERS.

This cut represents our 4-column All Iron Towers as built for supporting Tanks of small capacities, the design being the same as of the Tower described on the preceding pages.

This cut represents our 51-foot All Iron Tower and 2,000-gallon Cypress Tank.

FOR PRICES SEE PRECEDING PAGE.

We furnish these small Towers and Tanks principally to Florists, Gardeners and to Parties desiring Elevated Tanks for Private Grounds. They are suitable for supporting Tanks of small capacities for any purpose.

With each Tower we furnish Free Grates, Complete Plans, Specifications and Bills of Material for the Foundations; also for the Erection of the Tower Complete.

PLAIN CONICAL COVERS.

## TWELVE-COLUMN TOWER AND CYPRESS TANK.

This cut represents our Patent 12-Column Sectional All Iron Tower, which we build in sections, suitable to support Wooden Tanks from 22 feet in diameter up to and including 28 feet in diameter, and from 40,000 to 100,000 gallons capacity.

These Towers are used chiefly for city water-works and for fire protection, and in connection with automatic sprinklers for very large manufacturing plants.

This cut represents our 51-foot All Iron Tower and 60,000-gallon Cypress Tank.

This system of water supply and fire protection is fast superseding the stand-pipe for this purpose. Its superiority over the stand-pipe is readily understood by engineers and water-works contractors.

We furnish these Towers with Louisiana Red Cypress Tanks, as shown in cut; also with Tanks made of Iron or Steel, as shown in cut on opposite page.

**WRITE FOR LIST OF CITIES USING THIS SYSTEM.**

SEE PRICES OF TOWERS ON PAGE 14.  
Prices of Iron and Steel Tanks Furnished upon Application.

## TWELVE COLUMN TOWER AND STEEL TANK.

This cut represents our Patent 12-Column Sectional All Iron Tower which we build in sections, suitable to support Iron or Steel Tanks from 22 feet in diameter up to and including 28 feet in diameter, and from 40,000 to 100,000 gallons capacity.

In cut herewith, we illustrate our 12-Column Sectional All Iron Tower upon which is mounted a Steel Tank instead of a Cypress Wood Tank. In other respects, this is the same outfit as illustrated on opposite page.

SEE PRICES OF TOWERS ON PAGE 14.

This cut represents our 63-foot All Iron Tower and 100,000-gallon Steel Tank.

SEE PRICES ON PAGE 14.

## PLANS AND SPECIFICATIONS.

In building foundations and erecting towers for tanks, the first object to be considered is the proper dimensions, strength, etc., of the material to be used, as very few persons take into consideration, and, in fact, a great many do not realize, even if they know, the **great weight** contained in a comparatively small volume of water; for instance, **5,000 gallons** of water weigh **40,000 pounds**, or more than **20 tons**, and **20,000 gallons** weigh **165,000 pounds**, or more than **85 tons**, and **50,000 gallons** weigh more than **200 tons**. We know of an instance where a customer, in order to save a few dollars for a Plan, had a Foundation for a 10,000 gallon Tank erected on top of his mill building, designed by a local carpenter and builder, and this Foundation gave way under the load, broke through the roof, knocked out the end of the building, and caused a loss of over \$40,000 to machinery and stock alone. We can name a great many such instances. Therefore, we say **too much care** can not be given in building your Towers and Foundations of proper dimensions and proportions to give sufficient strength to carry, with safety, the load to be placed upon them, as well as to withstand the wind pressure to which they may be subjected, and, at the same time, have no more material in either Foundation or Tower than is actually necessary; for, if the foundation settle, or the timbers upon which the Tank rests should spring under the weight of the Tank and contents, the Tank will surely leak, and it will be impossible to make it hold without correcting the error, which often amounts to more than the **whole first cost** of a Tower **built of proper proportions** and on **correct principles**.

We frequently hear of Towers blowing down, or giving away, or springing so much out of shape that the Tank can not be made tight, and in **every** instance we have found that the Foundations or Towers were put up by inexperienced and incompetent persons who merely guessed at the strength required; and as it is very unsatisfactory and annoying to us, as well as to our customers, to have our Tanks set upon foundations such as will cause them to leak, we have concluded to offer, at a moderate price, to parties desiring to erect their own Towers, a complete set of Blue Print Drawings, with specifications and bills of materials for Foundations and Towers of design illustrated on page 16, for Towers up to and including 75 feet in height and for support of Tanks up to 25,000 gallons capacity.

**SEE PRICES OF PLANS AND SPECIFICATIONS ON PAGE 17.**

## ALL WOOD FRAMED TOWERS.

On the Opposite Page we give Prices of All Wood Towers illustrated by this cut.

This Tower is a well framed structure, with mortises and tenons all built of dressed heart timber and with joints well made, all mortises and brace seats being so formed that no water can lodge in them. It is thoroughly tied together with heavy angle rods and cast-iron washers.

We will furnish this Tower Complete, or the Iron Work Only, as parties may desire.

SEE PRICES ON OPPOSITE PAGE.

When Parties desire to build their own towers we will furnish Complete Plans, Specifications and Bills of Material at a nominal price.

SEE "PRICES OF PLANS AND SPECIFICATIONS" OF THIS STYLE OF TOWER ON OPPOSITE PAGE.

FOR PRICES OF PLANS, SPECIFICATIONS, ETC., SEE OPPOSITE PAGE.

THE HEIGHTS GIVEN ABOVE ARE OUR STANDARD HEIGHTS.

Why is Cypress the best wood for Tanks ?

Because it has not the knots and defects found in White Pine, Cedar and other woods.

## CYPRESS LUMBER.

The following extract is taken from the *Scientific American* of December, 1891:

Cypress timber, owing to its beautiful finish and durability and lightness, has long been in favor in the Gulf Coast States, and is fast growing in favor in the more Northern States, especially among those who have tested and know its many good qualities.

Cypress is especially adapted to BUILDING TANKS, TUBS AND VATS, and when used for such purposes IT NEVER WILL DECAY.

It also makes better Sash, Doors, Blinds and Frames than White Pine, and many Railroads use it for Water Tanks. It stands the weather better than White Pine; does not WARP or TWIST, and does not SHRINK or SWELL.

NO LUMBER in the WORLD equals it for Tanks, Vats, Siding or Weather Boards, Exposed Floors or Shingles. Siding can be used and not painted, and will last fifty years.

The DURABILITY of CYPRESS is illustrated by the examples of ROOFS in Mobile and New Orleans in good order laid SIXTY YEARS ago.

---

## FIVE REASONS

### Why Cypress Lumber Makes the Best Wood for Tanks.

*First:* It will last for ages without decay.

*Second:* It does not shrink and swell like other woods.

*Third:* It does not warp or twist when exposed to the weather.

*Fourth:* It has not the knots and defects found in White Pine, Cedar and other woods.

*Fifth:* When seasoned it is lighter than all other woods, assuring cheaper transportation.

# IRON AND STEEL TANKS.

---

Having in connection with our works a well equipped Foundry and Machine Shop, also a full line of Sheet Metal Machinery, we are prepared to furnish at the lowest possible prices Tanks of any dimensions made of Iron or Steel.

" " " "	82 50	92 50	" " " 3 inch pipe	5 00
Tank Outlet Valves	12 00	15 00	" " " 4 "	7 50

Why is Cypress the best wood for Tanks ?

Because it has not the knots and defects found in White Pine, Cedar and other woods.

## USEFUL INFORMATION—WATER.

Doubling the diameter of a pipe increases its capacity four times. Friction of liquids in pipes increases as the square of the velocity.

The mean pressure of the atmosphere is usually estimated at 14.7 lbs. per square inch, so that with a perfect vacuum it will sustain a column of mercury 29.9 inches or a column of water 33.9 feet high.

To find the pressure in pounds per square inch of a column of water, multiply the height of the column in feet by .434. Approximately, we say that every foot elevation is equal to  $\frac{1}{2}$ -lb. pressure per square inch; this allows for ordinary friction.

To find the diameter of a pump cylinder to move a given quantity of water per minute (100 feet of piston being the standard of speed), divide the number of gallons by 4, then extract the square root, and the product will be the diameter in inches of the pump cylinder.

To find quantity of water elevated in one minute running at 100 feet of piston speed per minute, square the diameter of the water cylinder in inches and multiply by 4. Example: Capacity of a 5-inch cylinder is desired. The square of the diameter (5 inches) is 25, which, multiplied by 4, gives 100, the number of gallons per minute (approximately).

To find the horse-power necessary to elevate water to a given height, multiply the total weight of the water in pounds by the height in feet, and divide the product by 33,000 (an allowance of 25 percent should be added for water friction, and a further allowance of 25 per cent for loss in steam cylinder).

The area of the Steam Piston, multiplied by the steam pressure, gives the total amount of pressure that can be exerted. The area of the Water Piston, multiplied by the pressure of water per square inch, gives the resistance. A margin must be made between the power and resistance to move the pistons at the required speed—say from 20 to 40 per cent according to speed and other conditions.

To find the capacity of a cylinder in gallons. Multiplying the area in inches by the length of stroke in inches will give the total number of cubic inches; divide this amount by 231 (which is the cubical contents of a U. S. gallon in inches), and product is the capacity in gallons.

To find the number of gallons in a Tank, multiply the inside bottom diameter in inches by the inside top diameter in inches, then this product by 34; point off four figures and the result will be the average number of gallons to one inch in depth of the Tank.

### Weight and Capacity of Different Standard Gallons of Water.

	Cubic Inches in a Gallon.	Weight of a Gal- lon in Pounds.	Gallons in a Cubic Foot.	Weight of a cubic foot of water, English standard, 62.321 lbs. Avoirdupois.
Imperial or English . . . .	277.274	10.00	6.232102	
United States . . . . .	231.	8.33111	7.480519	

Weight of Crude Petroleum,  $6\frac{1}{2}$  lbs. per U. S. gallon . . } 42 gallons to the barrel.  
Weight of Refined Petroleum,  $6\frac{1}{2}$  lbs. per U. S. gallon, }

A "miner's inch" of water is approximately equal to a supply of 12 U. S. gallons per minute.

### Fire Streams.

Pressures required at nozzle and at pump, with quantity and pressure of water necessary to throw water various distances through different size nozzles—using  $2\frac{1}{2}$ -inch rubber hose and smooth nozzle.

G. A. ELLIS, C. E.

Size of Nozzles.	1 Inch.				$1\frac{1}{8}$ Inch.				$1\frac{1}{4}$ Inch.				$1\frac{3}{8}$ Inch.			
Pressure at nozzle . . . . .	40	60	80	100	40	60	80	100	40	60	80	100	40	60	80	100
*Pressure at Pump or hy- drant with 100 feet $2\frac{1}{2}$ - inch rubber hose . . . . }	48	73	97	121	54	81	108	135	61	92	123	154	71	107	144	180
Gallons per minute . . . . .	155	189	219	245	196	240	277	310	242	297	342	383	293	358	415	462
Horizontal distance thrown	109	142	168	186	113	148	175	193	118	156	186	207	124	166	200	224
Vertical distance thrown .	79	108	131	148	81	112	137	157	82	115	142	164	85	118	146	169

\*For greater length of  $2\frac{1}{2}$  hose the increased friction can readily be obtained by noting the differences between the above given "pressure at nozzle" and "pressure at pump or hydrant with 100 feet of hose." For instance, if it requires at hydrant or pump 8 lbs. more pressure than it does at nozzle to overcome the friction when pumping through 100 feet of  $2\frac{1}{2}$  inch hose (using 1 inch nozzle, with 40 lb. pressure at said nozzle), then it requires 16 lbs. pressure to overcome the friction in forcing through 200 feet of same size hose.

## A FEW OF THOSE USING OUR TOWERS.

- Alabama Cotton Oil Co., Mobile, Ala., one 63-foot Tower and 30,000-gallon Steel Tank.
